OVERVIEW

Performance & Core Web Vitals

Measured via GTmetrix (Chrome 142, Lighthouse 12.6.1) from Seattle, WA. The site earns an **A grade** with strong scores overall — the main opportunities are around JavaScript weight and caching.

LOAD TIMELINE

Key timing milestones

Read this: The page paints fast (LCP < 900ms) so it **feels** quick, but full load stretches to 16.4s and interactivity to 5.2s — driven by 51 scripts (46 third-party) totaling 1.34MB of JavaScript. This is the single biggest lever for improvement.

PAGE COMPOSITION

What the page is made of

Total page size is **1.63MB across 96 requests**. JavaScript dominates both size and request count — the clearest optimization target.

TOP ISSUES — FROM GTMETRIX

Audit findings

SEVERITY	ISSUE	DETAIL
MED-LOW	Serve static assets with an efficient cache policy	Potential savings of 368KB — set long-lived cache headers on static files.
LOW	Avoid long main-thread tasks	5 long tasks found — blocks interactivity, contributes to the 5.2s TTI.
LOW	Use a Content Delivery Network (CDN)	2 resources could be served from a CDN for faster global delivery.
LOW	Avoid large layout shifts	2 layout shifts found — the cause of the 0.09 CLS score.
LOW	Reduce JavaScript execution time	600ms spent executing JavaScript on the main thread.

Root cause: The site is built on **GoDaddy Website Builder**, which injects a large volume of generic third-party scripts. Most performance issues trace back to this — a lighter, purpose-built front end (already prototyped in the Enshield mockup) removes the bulk of them.

SEARCH READINESS

SEO audit

Analyzed via Chrome DevTools. Fundamentals are solid — metadata and social cards are well configured — with a few structural fixes worth making.

● Strengths

- **Title & description** — clear and descriptive meta tags present.
- **Open Graph & Twitter cards** — correctly implemented for social sharing.
- **Canonical URL** — present, pointing to the main domain.
- **Viewport & lang** — mobile viewport and **en-US** set correctly.

● Fix these

- **Heading hierarchy** — jumps H1 → H2 → H4, skipping H3. Break logical order for crawlers.
- **Empty image alt** — the logo has **alt=""**; set **alt="Enshield Logo"**.
- **Single H1** — good, but feature blocks should be H3 under their H2.

INCLUSIVE DESIGN

Accessibility audit

● Working well

- **<nav> landmark** present for primary navigation.
- **Icon links labelled** — hamburger & cart use aria-label.
- **Language declared** on the html element.

● Needs attention

- **Missing <main> & <footer> landmarks** — hurts screen-reader navigation.
- **Unlabelled links** — several **<a>** tags have no text or aria-label.
- **Contrast** — verify text hits WCAG AA 4.5:1, esp. on light theme (#e5f1f2).

PRIORITIZED

Recommendations & next steps

Ordered by impact-to-effort. Tackling the top three addresses the majority of the load-time and search issues.

1

Cut JavaScript weight

Audit the 51 scripts (1.34MB). Remove or consolidate unused third-party GoDaddy scripts — the biggest win for TTI (5.2s) and full load (16.4s).

HIGH

2

Set an efficient cache policy

Add long-lived cache headers to static assets — GTmetrix flags 368KB of savings available immediately.

HIGH

3

Add semantic landmarks

Wrap content in <main> and the base in <footer> for accessibility and SEO structure.

MEDIUM

4

Fix heading hierarchy

Change feature H4s to H3 so the outline flows H1 → H2 → H3 without gaps.

MEDIUM

5

Lazy-load below-fold images

Add loading="lazy" — currently 0 images use it — to speed initial paint.

MEDIUM

6

Add descriptive alt text

Set the logo alt to "Enshield Logo" and label remaining icon-only links.

LOW

7

Resolve layout shifts & add a CDN

Fix the 2 CLS-causing shifts (reserve space for media) and serve static assets via CDN.

LOW

The strategic takeaway: enshield.com already scores an A on raw metrics — but nearly every remaining issue stems from the GoDaddy builder's script bloat and rigid structure. Migrating to the lightweight, purpose-built front end (the React mockup) resolves the caching, JS-weight, semantic-HTML, and heading issues in one move — while unlocking the premium look and animation the brand deserves.
